

Visualization Report

Dashboard Setup Explanation

After extracting named entities from live news articles using Kafka and spaCy, all the entities were stored in an Elasticsearch index named named_entities.

A Data View was created in Kibana over the named_entities* index. This made it easy to explore and visualize the entity data.

Using Kibana's Lens visualization tool, charts were built based on the entity.keyword field to display the most frequently occurring named entities from the real-time news stream.

An auto-refresh interval of 10 seconds was enabled to ensure that the dashboard dynamically reflected newly incoming data in near real time.

Visualizations Created

Bar Chart – Top Named Entities

Type: Bar Chart

Field Used: entity.keyword

Metric: Count (number of times each entity appears)

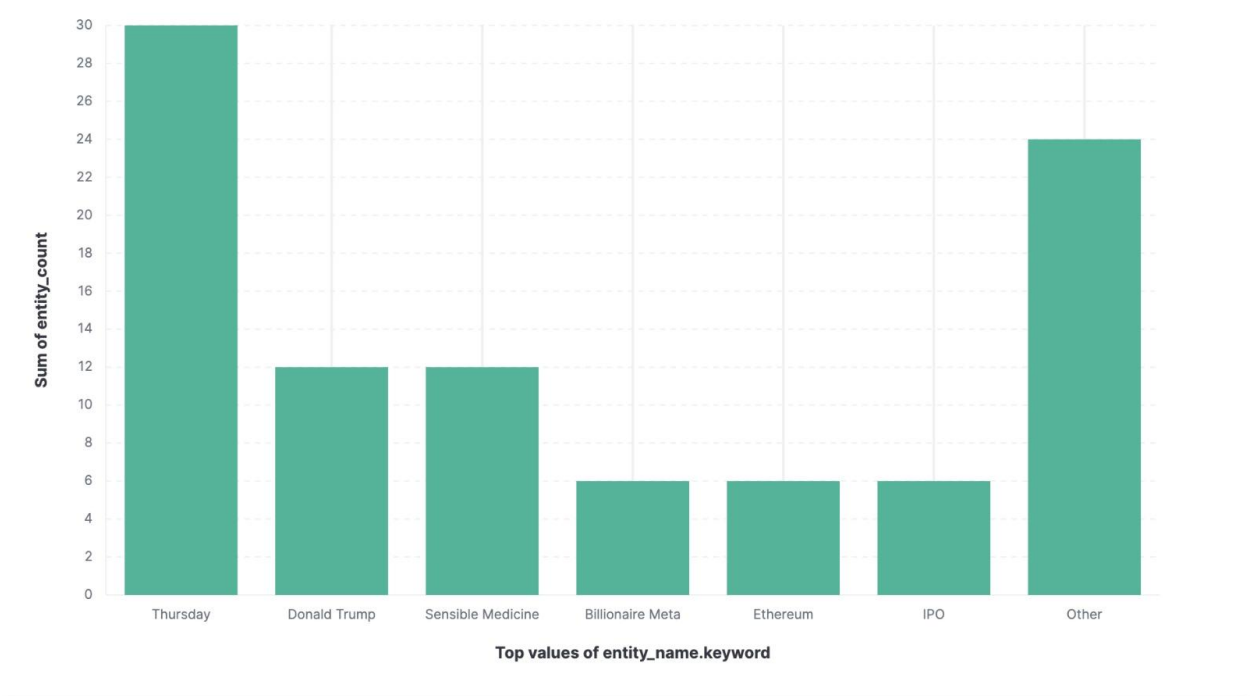

These charts visualized the most frequently mentioned named entities at different time intervals

Dashboard

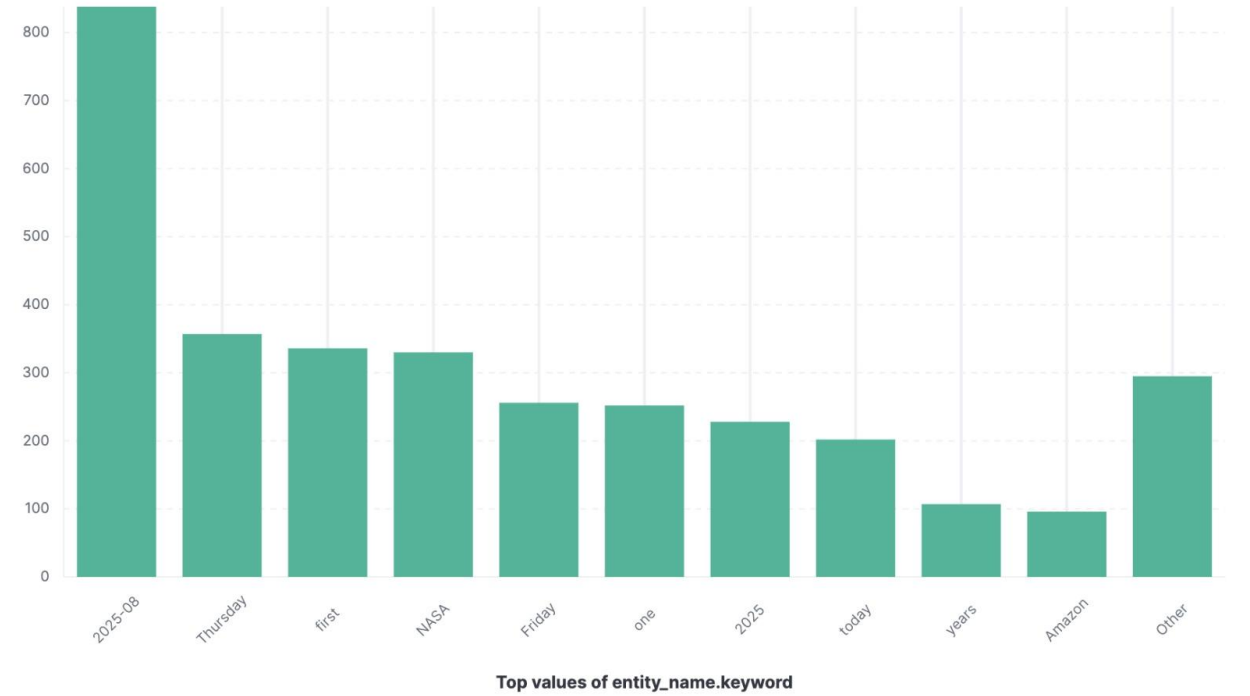

The bar chart was integrated into a simple dashboard layout within Kibana.

Auto-refresh was enabled to maintain a live, updating view of entity trends as new data arrived.
